Advanced Heat Transfer Chapter 1: Introduction Y.C. Shih Spring 2009 1-3 Convection (1) Convection is the mode of energy transfer between a solid surface and the adjacent liquid or gas that is in motion. It involves the combined effects of conduction and fluid motion. The faster the fluid motion, the greater the convection heat transfer.

The average treatise on heat transfer dismisses free convection in a single chapter. It is, nevertheless, potentially as large a subject as forced convection, and has developed rapidly within the last decade. The present review acknowledges this situation by confining its attention to one aspect only, that of free convection on a vertical surface.

Before getting into further details, a review of some of the physics of heat transfer is in order. As you recall from undergraduate heat transfer, there are three basic modes of transferring heat: conduction, radiation, and convection. Conduction is the transfer of heat through a medium by virtue of a temperature gradient in the medium.

The reasons beyond these conflicts are reviewed. In addition, this paper describes flow and heat transfer in porous media as a well-modeled passive enhancement method. It is found that there are very few works which dealt with heat transfer enhancements using systems supported with flexible/flexible-complex seals.
